SalarySe · Product design challenge

Make Scoins feel like money

Design decisions behind the Scoins wallet, the Earn experience and the redemption flows: what each screen says, and why it says it that way.

The lever: 5 Scoins = ₹1 spent on SalarySe, 10 Scoins = ₹1 to bank. Spending in-app is worth 2×, and almost nobody knew.

The answer: lead with rupees, make the better rate the default without hiding the other, and give every state a next step.

CORE FLOWS: VALUE WITHIN 3 TAPS

Spend	Wallet → pick a deal → review saving → confirm → voucher
Withdraw	Wallet → enter ₹ amount → UPI ID → swipe → OTP → receipt
Earn	Wallet → next reward → pay via UPI → reward lands
Trust	History row → source, rule and balance after

Interactive prototype: claude.ai/artifact/VrxVM3azJxau7ZQbx6ibTs · All earn amounts, deals and card figures are illustrative.

Why Scoins feel useless today

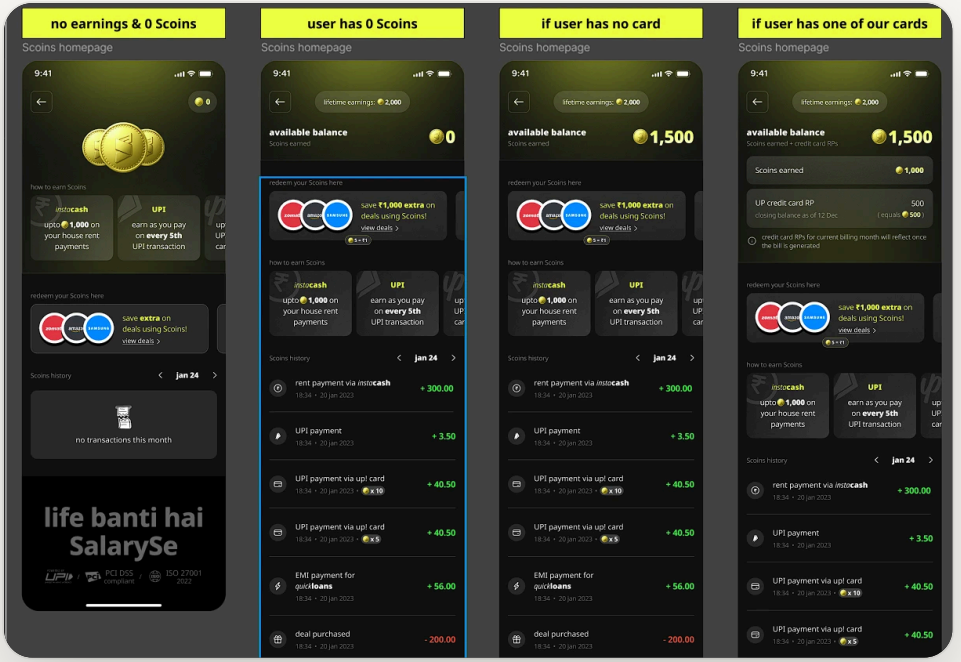

Users hold Scoins but can’t tell what they’re worth, so they don’t use them. The fact that matters most, that Scoins are worth 2× inside SalarySe, appears only after they choose to cash out.

Problems

1. **Value is hidden:** points, no rupee figure.
2. **No rate comparison:** users learn cash-out halves the value too late.
3. **Zero is a dead end:** new users see “0” and no way to earn.
4. **Earning is invisible:** no progress, no reason to return.
5. **Low trust:** no receipts, no clear history.

What I fixed first

1. **Trust:** every amount shows its unit and ₹ value.
2. **Rupees first,** bank value beside it.
3. **A next step** in every state.

Before: the current wallet across its four states.

Six principles behind every screen

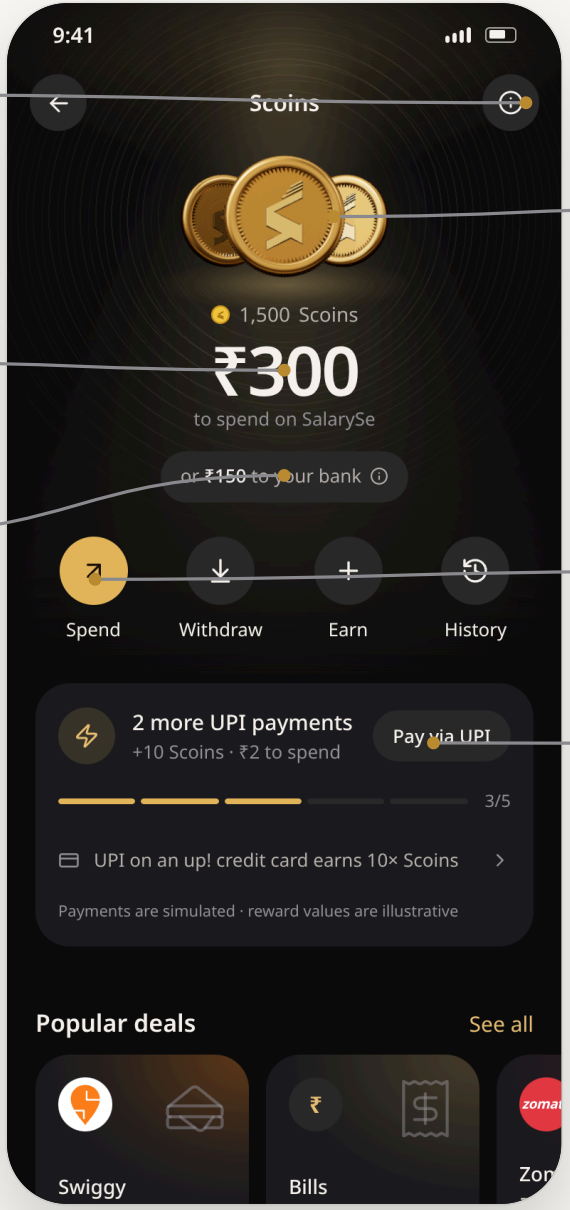

1. **Lead with rupees.** Users think in money, so the in-app ₹ value is always the headline.
2. **Show both rates, rank them.** 5 = ₹1 leads; 10 = ₹1 is always visible and never guilt-framed.
3. **Every amount carries its unit.** No bare numbers or fractional Scoins that could be misread as rupees.
4. **Spending is saving.** Redemptions read “Saved ₹50”, so using Scoins feels like a gain, not a loss.
5. **The balance always reconciles.** Earned − spent − withdrawn = available; pending is kept separate.
6. **One next step per state.** Zero, low or full balance, users always know what to do next.

Users see what their Scoins are worth before anything else

Help is always one tap away: "how do Scoins work?" is answered from any state

Answers "what is it worth?" at a glance: ₹300 to spend, not 1,500 points

The cash-out value is never hidden, so spending in-app feels like a choice, not a trick

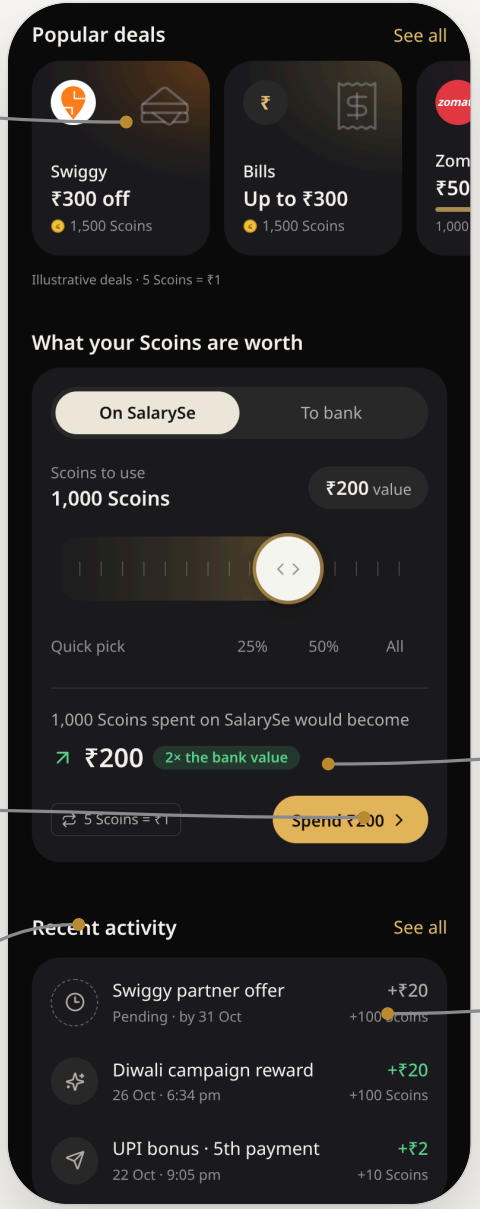

Playful but out of the way: users can spin the coins, the balance is never covered

Every key job is one tap away: spend, withdraw, earn or check history

Users always know their next reward, what it pays and how close they are

Every explanation ends in something users can do

Affordable deals come first; the rest say exactly how many Scoins are missing

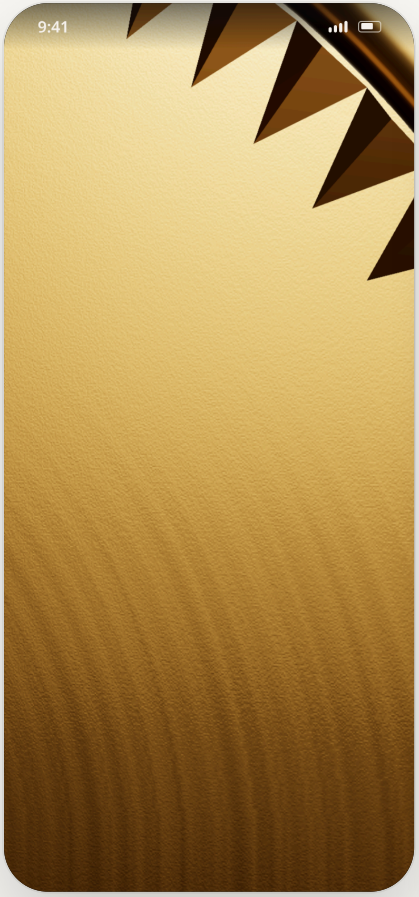

Exploring turns into doing: the chosen amount carries straight into Spend or Withdraw

The page follows intent: earn, spend, explore, then review what happened

The trade-off is shown, not argued: the same Scoins in ₹ in-app vs ₹ to bank

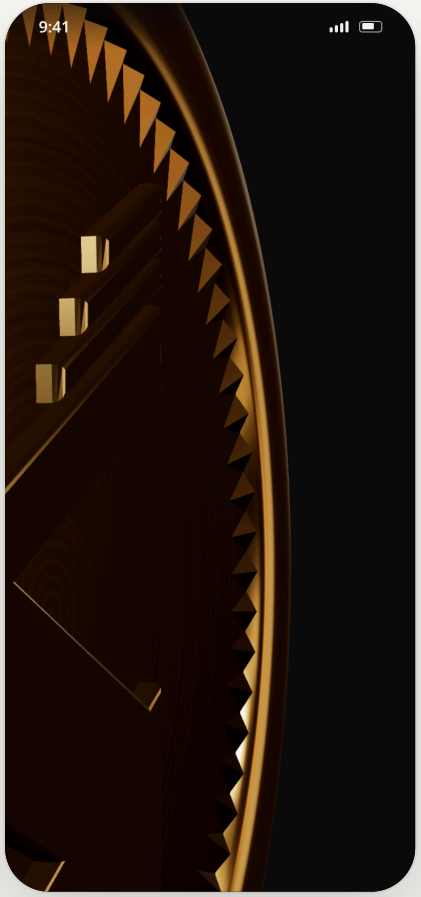

History reads like a bank statement: rupees first, savings shown as gains

A short entrance that ends on the balance

0.0s · Close-up

Sets the tone: Scoins are something of value, not loyalty points.

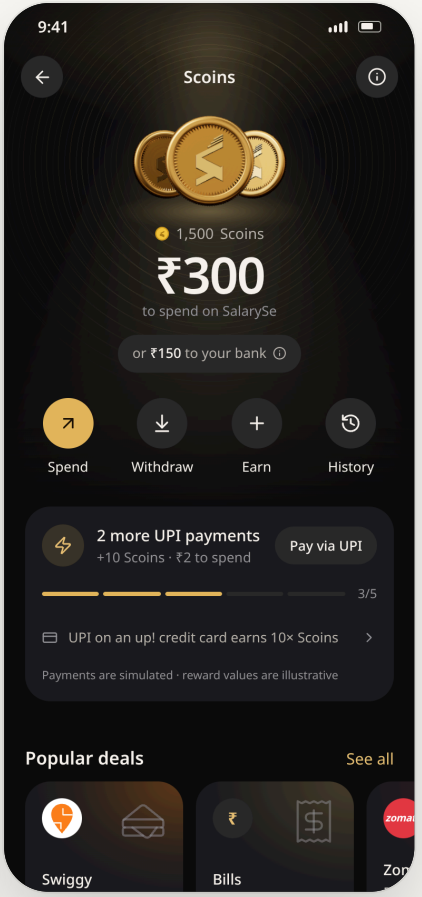

0.7s · Turn

One continuous move, under 3 seconds, so it never delays the user.

1.9s · Formation

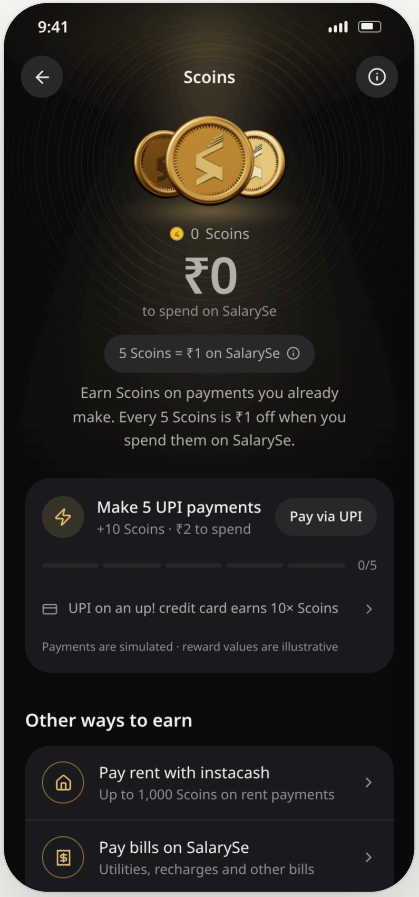

Returning users start here: a shorter version they won't tire of.

3.0s · Wallet

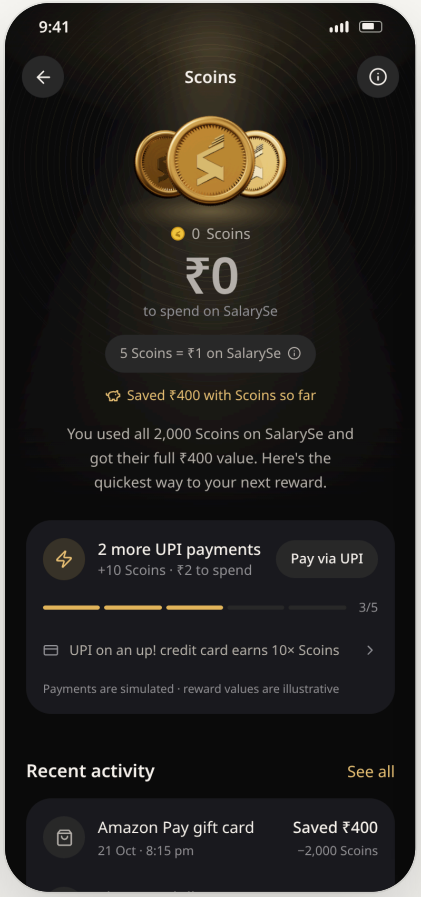

Ends on the rupee balance. Skippable, and static with reduced motion.

Each state gets its own message and next step

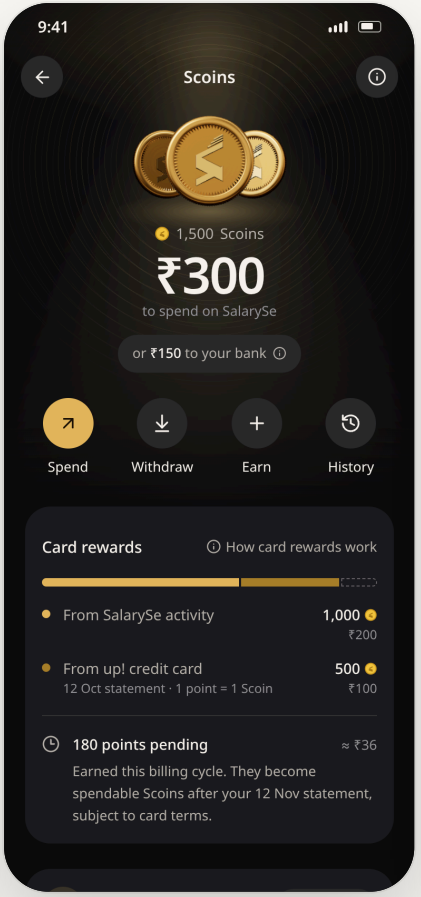

New user

Explains what Scoins are worth and starts a first reward (0 of 5). No empty history.

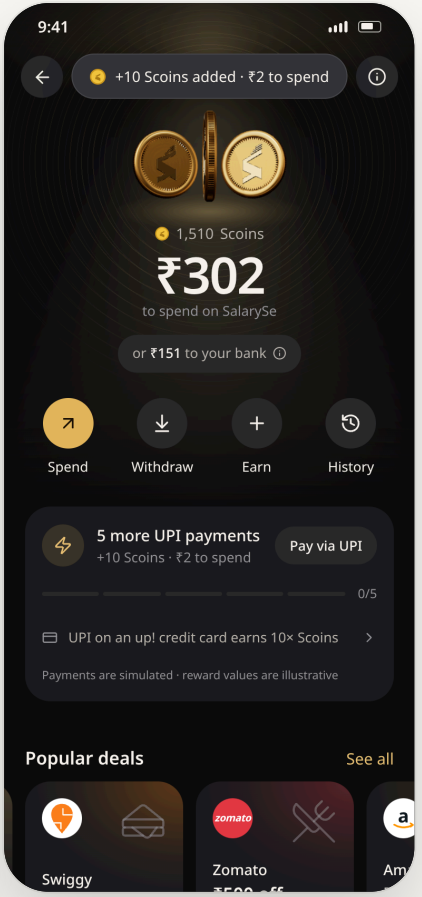

Spent everything

“Saved ₹400 with Scoins so far” turns zero into proof of value, then points to the next reward.

Cardholder

Balance split by source, with pending card points and when they become spendable.

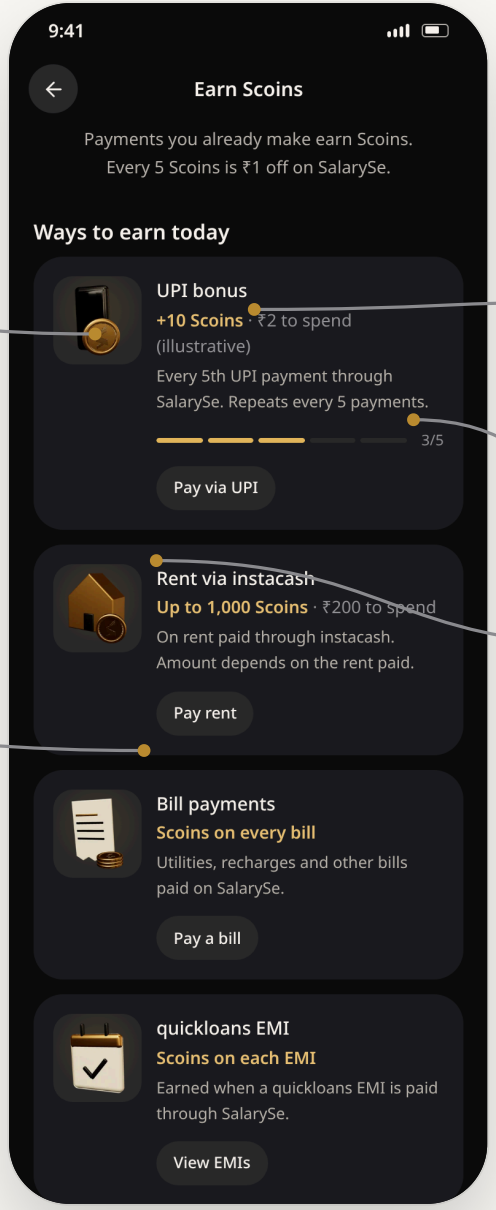

Reward lands

The coin turns, the balance counts up and a toast confirms “+10 Scoins · ₹2 to spend”.

Users see what earns, how much, and the one step to take

Each way to earn is recognisable at a glance, so users scan instead of read

Only real product rules are stated; nothing promises a reward we can't confirm

Every card answers the same questions: what to do, what it pays in ₹, and the limits

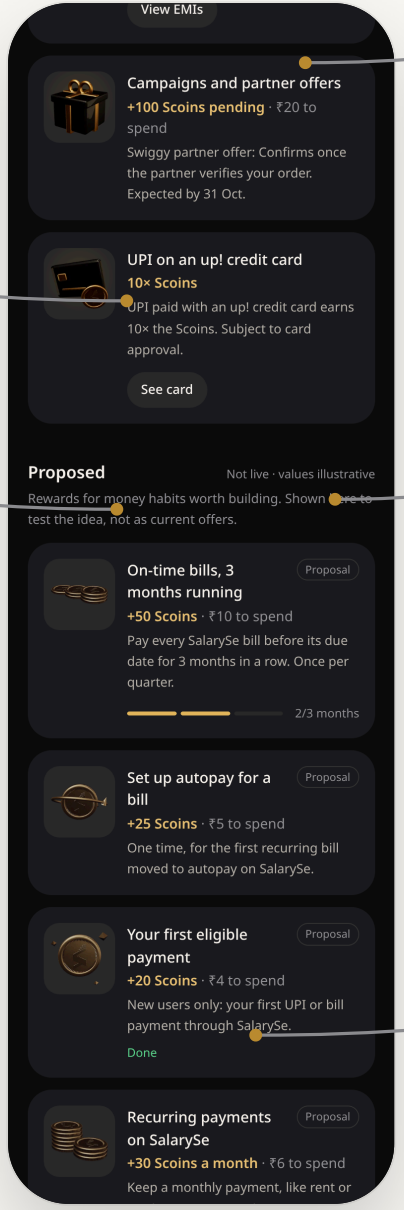

Progress shows only where there is a real target, so it always means something

One action per card, taking users straight to the payment that earns

New habits worth rewarding, clearly marked as proposals

Non-cardholders get one line about the card, so the wallet never feels like an ad

Rewards push good money habits: paying on time and on autopay, never borrowing more

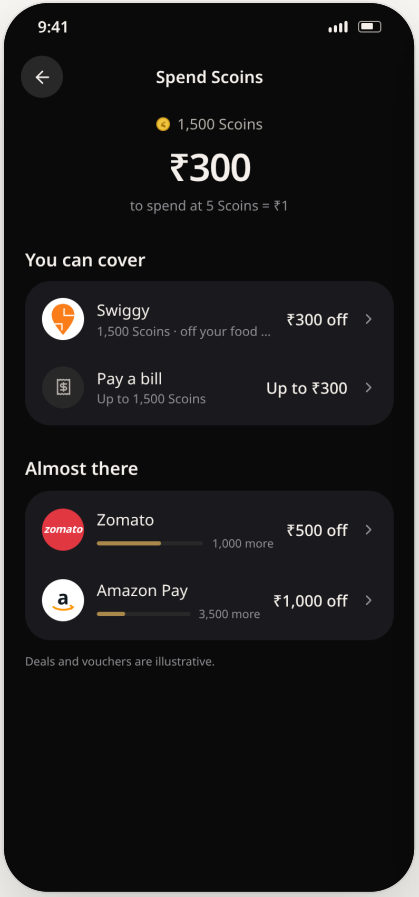

Campaign rewards show as pending until confirmed, so users never feel short-changed

Proposed ideas are labelled, so users never mistake them for live offers

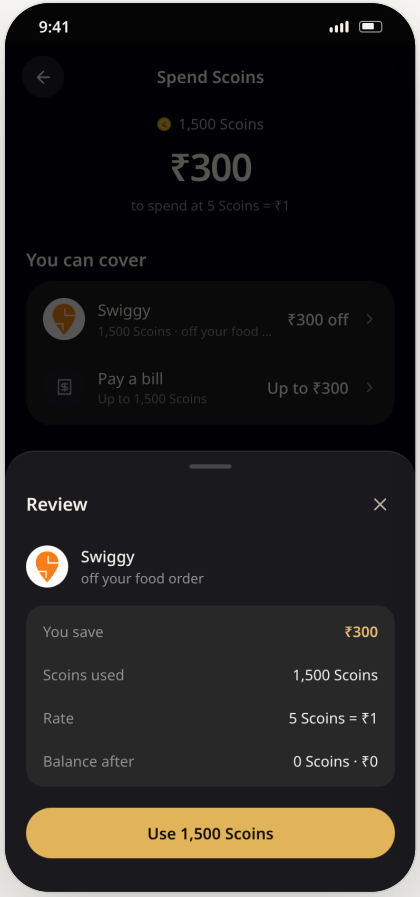

Caps and one-time rewards keep the system fair and hard to game

Review exactly what it costs and saves, then celebrate

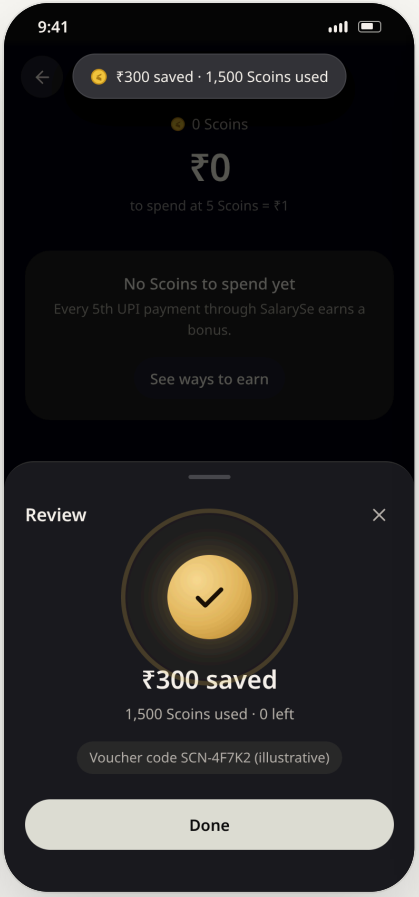

Choose

“You can cover” first, “Almost there” second, each with the Scoins still needed.

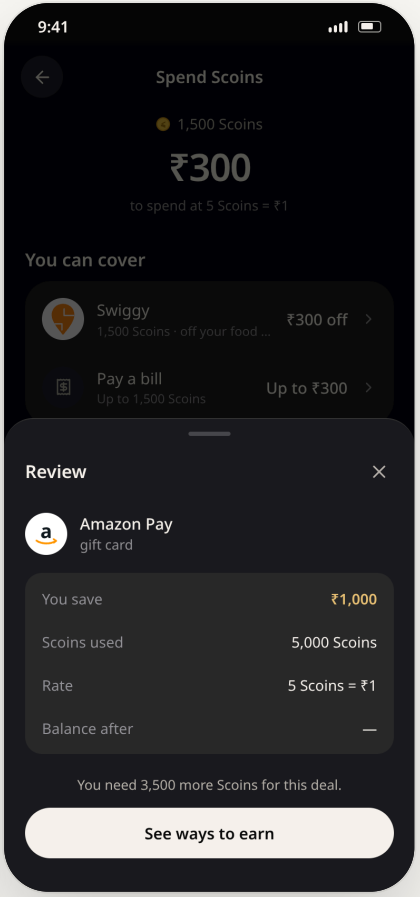

Review

You save, Scoins used, the rate and the balance after. One button names the exact cost.

Success

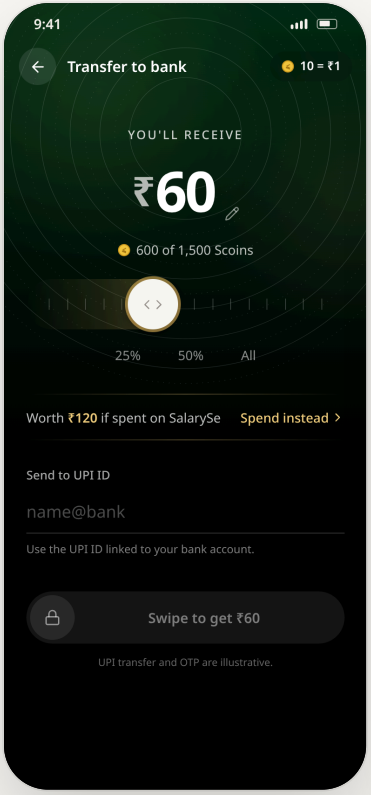

The exact saving, the Scoins used and what is left, with the voucher or bill outcome.

Not enough Scoins

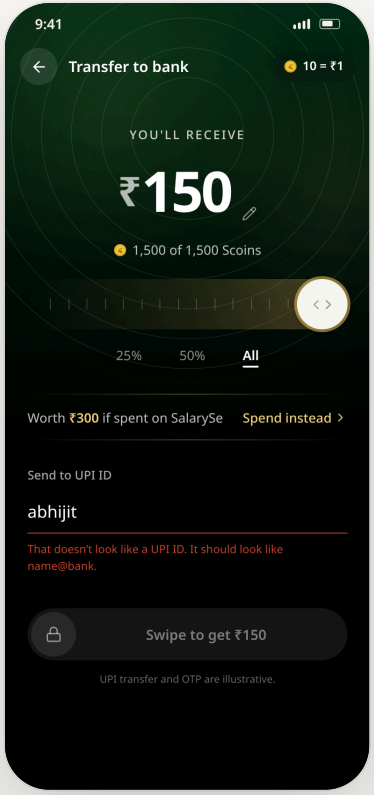

Says exactly how many more are needed and offers a way to earn, not a dead button.

Cashing out stays simple, safe and fully informed

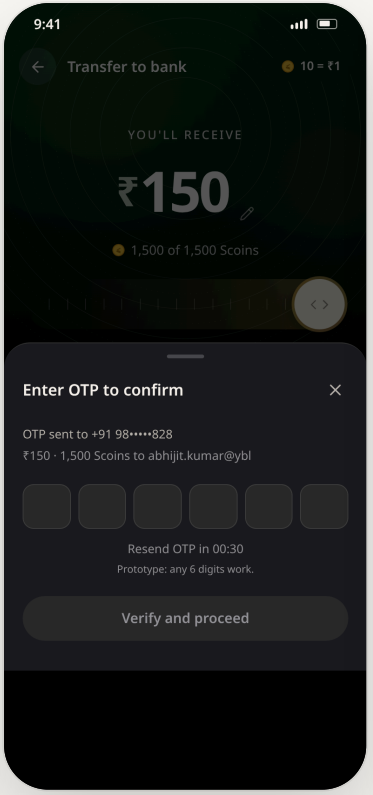

Amount

Type or slide to an exact ₹ amount, and see what it would be worth if spent instead.

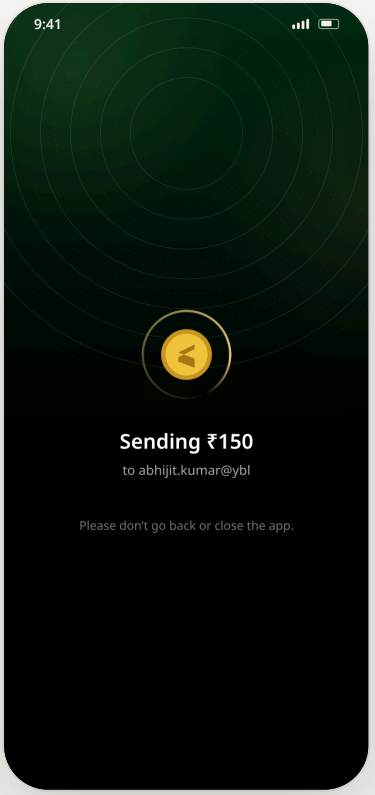

UPI ID checked

The swipe stays locked until the UPI ID is valid, with the fix in plain words.

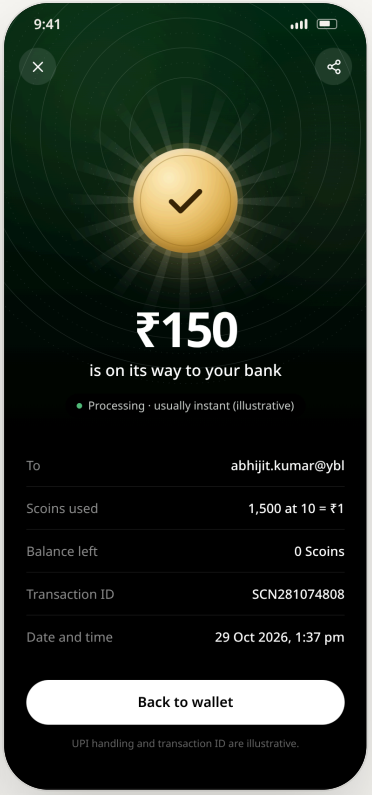

OTP

A one-line summary shows exactly what is being confirmed before verifying.

Processing

Amount and destination stay on screen, so users know nothing is lost while waiting.

Receipt

Amount, Scoins used, balance left and transaction ID, ready to share.

Reward good money habits, never more borrowing

Guardrails

- No mechanic rewards borrowing more or spending for its own sake.
- Streaks reward paying on time, never paying more.
- Caps stop gaming: the UPI bonus resets every 5 payments; recurring rewards cap at 3.
- Withdrawing is always one tap away and never framed as a loss.
- Every illustrative value is labelled, and the two rates never change.

What I'd test first

1. **Five-second test:** ask “What are your Scoins worth?” before and after. Success means most users answer in rupees.
2. **First redemption:** deals ranked by what the balance covers vs a generic list.
3. **In-app share of Scoins:** side-by-side rates vs today’s cash-out popup.

How I made this

Designed in **Figma**: every screen, flow and component state. **Claude** helped turn the designs into a working React prototype; **ChatGPT** helped sanity-check copy and research; **Vercel** hosts the live prototype.
