People don't use Scoins because they can't tell what they're worth

Goal: every user knows their balance in rupees, the better way to use it, and the next step to earn more.

5 Scoins = ₹1

Spent in-app (deals, bills). 2× the value.

10 Scoins = ₹1

Withdrawn to bank via UPI.

Same balance, two prices

Users must see both before they choose.

PROBLEMS

1. **Value is hidden.** The balance shows as points with no rupee figure.
2. **Two rates, no comparison.** Withdrawing costs half the value, and users only find out afterwards.
3. **Zero balance is a dead end.** New users see "0" and no way to earn.
4. **Earning is invisible.** No progress toward the next reward, so no reason to come back.
5. **Low trust.** No receipts and no history explaining where Scoins came from or went.

USER QUESTION → ANSWER ON SCREEN

- **"What's it worth?"** → the balance in ₹ first, Scoins second, the bank value alongside.
- **"What can I get now?"** → deals the balance already covers, sorted by saving.
- **"How do I get more?"** → the next reward with progress (3/5 UPI payments).
- **"Is cash-out worth it?"** → the exact ₹ you receive, plus what the same Scoins buy in-app.
- **"Did it work?"** → a receipt, the balance left, and the transaction in history.

EVERY STATE HAS ONE CLEAR ACTION

STATE	USER SEES	PRIMARY ACTION
New, ₹0	How Scoins work, and the first reward to aim for	Make 5 UPI payments
Has balance	₹ value, deals covered, next reward	Spend on a deal
Cardholder	Card rewards and the 10× UPI boost	Pay with the card
Spent all	What was saved and the next reward	Earn again
Not enough	The exact shortfall in Scoins	See ways to earn

CORE FLOWS: VALUE WITHIN 3 TAPS

Spend	Wallet → a deal you can cover → review: you save ₹, Scoins used, balance after → confirm → voucher + balance left
Withdraw	Wallet → amount in ₹ (in-app value shown) → UPI ID checked inline → swipe → OTP → receipt
Earn	Wallet → next reward → pay via UPI → progress moves → reward lands with a toast
Trust	Any history row → what it was, the rule that earned it, the running balance

Values, deals and partner brands are illustrative.

Make earning visible, spending easy, and cashing out an informed choice

BEHAVIOUR MODEL (B = MAP)

- **Motivation:** a ₹ figure, not points. "₹300 to spend" pulls harder than "1,500 Scoins".
- **Ability:** deals the balance already covers come first, amounts are prefilled, and one review screen.
- **Prompt:** UPI progress (3/5), a reward-landed toast, "Almost there: 200 more Scoins".

Pay via UPI → progress → reward → spend in-app → save ₹ ↻

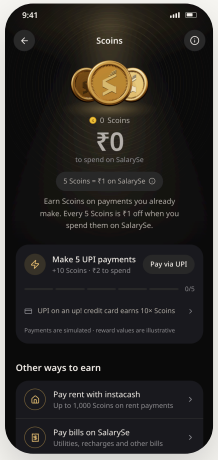

GUARDRAILS: NO DARK PATTERNS

- Withdraw is always one tap from the wallet. In-app is the better deal, never a forced one.
- The rate is shown on every amount, in both directions.
- A failed transaction never touches the balance, and it says so.
- Deliberate gestures for money out: swipe, then OTP.
- Balance = earned − spent − withdrawn, reconciled on every change.

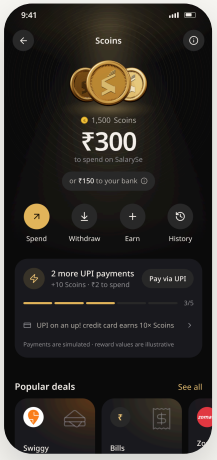

MEASURE

METRIC	TELLS US
First reward ≤ 7 days	The zero-balance state works
Redemption rate	Value is understood
In-app share of redemptions	The 2× value lands
Withdraw → spend switches	The comparison is seen
UPI payments per user	The earn loop holds
"Where did my Scoins go?" tickets	Trust goes up as these fall

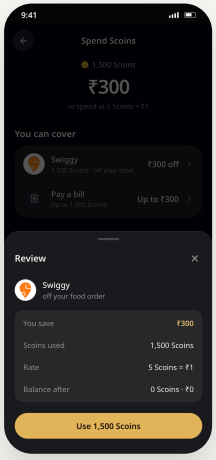

KEY MOMENTS

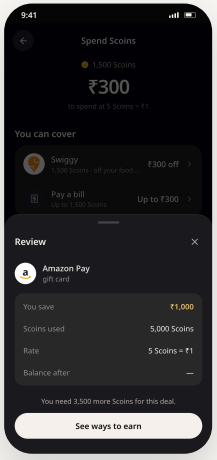

₹0: how to earn, not an empty wallet

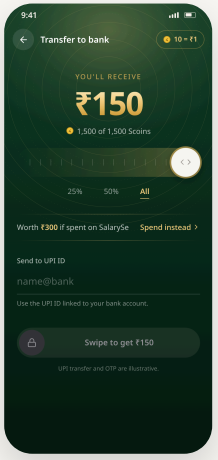

Balance in ₹ first, next reward below

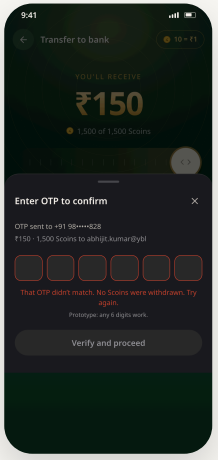

Review: saving, cost, balance after

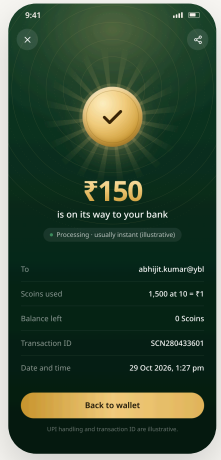

Short: the exact gap, then a way to earn

Cash-out: exact ₹, with the in-app value beside it

Failure: "No Scoins were withdrawn"

Receipt: amount, ID, balance left

Interactive React prototype covering all four user states.
